

UAE National Youth Tobacco Survey 2001 is part of the World health Organization's Global Youth Tobacco Survey project. In the UAE, the survey is to be carried out jointly by the Ministry of Health and Ministry of Education.

The survey is targeted towards school pupils aged 13 to 15 years in all schools. The objective of this national survey is to collect relevant data on smokers in this target group and elicit information on what age pupils start smoking, their behavioral patterns, reasons to indulge in this practice, how they get cigarettes, extent of smoking, and whether there is any program in individual school curriculum that explains smoking hazards.

Assume that you are a part of the survey team. *Design an appropriate questionnaire* to conduct the survey, keeping in mind the target group and the objectives of the survey. Your questionnaire should have *13 questions* and should not take more than 20 minutes of the respondent's time.
