CYTOKINES
CHUMILU
Cytokines:-
LOW M.W Proteins (<30 kDa)
Many are glycoproteins
They have regulatory functions & help in communication b/w immune
The court of this office than the cells as well
Other functions include grow promoting growth of proliferation of
ummune cells directing immune cells to site of a infection.
Class of
Chemokines: Cytokines that mobilize immune cells from one
location to another. Type of chammetractant
Mode of Action -
Autocrine - Action on the same cell that secreted the cytokines
Paracrine - Action of cy Cytokines secreted by a cell acts on
Cour that are closely incored
Lo Endocrine - The cytotine secreted by a cell act on a
distant cell via the circulatory system.
Professies: • Pleiotrophy - the same cytokine has have diff.
functions for diff. farget colle
B-cell Activation Proliferation Differentiation
Mast ceu: Proliferation
Thymocyte: Protiferation
· Redundancy - Diff. Cytokines have the same
tunction.
eg: 11-2, 11-4, 11-5 → B-cell: proliferation
· synergy - when two cytokines have higher efficiency
in its effect when combined
eg: 11-4, 12-5: Individual induce class switch to Igh
11-4+12-5: Class switch is more effective
11.00

	Fas Ligand: Receptor — FAS life & death of an moment cell.
	Sololy ummune cell.
	responsible for death
	FAS signalling-
	Pas induces cell death through the process of Apophosi's.
	Apoptosis - Process of cell death from within.
•	Fash binds to Fas - induces Apoptosis -> cell death
	Fas before binding to Fash is monomeric. Once Fas
20	is bound it undergoes trimerization.
0	The land of the supplied on Collect
	Death Domain. These domains interact with the Death
	domains of FADD [Homotrophic Interaction].
	FADD also has a death effector domain which helps to recruit an inactive protease (cysteine protease) called
	recruit an inactive Protease (Cysteine Protease) caued
	procaspase 8 -> 1+ breaks Perhide bonds after Aspartic acid.
	FADD effector domain helps recruit procaspase 8 which
Ú.	becomes active and gives leaspases (caspase 8).
	caspase 8 is released into the CytoPlasm.
•	caspase 8 will proteolytically digest procaspase 3 and
	Procaspase 7, making it active.
•	caspase 3 and 7 will proteolytically digest apoptotic
	enzymes making it active and induces Apoptosis in
	the cell.
